JAS is a good environmental health governance and close to people. It can be a source of information on the environment which is different from the usual health related information ([@ref-58]). The use of GIS and DSS in environmental research could be useful to provide better management and plan. Discussion ===== Improving the accessibility of population geodata is now an important and ongoing project. The main aim of the project is to create the Indonesian Online Health Atlas. To achieve this objective, various data sources should be processed and combined. Building the Indonesian Online Health Atlas is a complex task as it is expected that the process requires enormous investments of time and manpower. The process of development could take several years to complete. The main tasks in the development phase are the extraction of data from diverse sources, the creation and updating of a database, and, finally, the release of an online application. The most appropriate data sources for the development of the Indonesian Online Health Atlas are the cadastre, hospital, and health insurance data.

These data sources are collected from official databases, often of different geographical areas, and are of clear value for the development of public health infrastructures and thus the development of the Indonesian Online Health Atlas. Advantages ----- The creation of the Indonesian Online Health Atlas will provide opportunities to efficiently manage public health in Indonesia. The most important advantages of the Indonesian Online Health Atlas are: \ (1\ The Indonesian Online Health Atlas is an online application and the health data will be freely accessible. \ (2\ The integration of multiple databases for environmental and health data will make the data easy to use and more comprehensive. \ (3\ The Indonesian Online Health Atlas will have the basic information related to Indonesian health status, which provides baseline data for evaluating the improvement of Indonesia's health status. Limitations ----- Although this is a great step towards the creation of a public health infrastructures in Indonesia, the Indonesian Online Health Atlas is still in an early phase. The project team has already developed an outline of the Indonesian Online Health Atlas and have begun to compile the data. The creation of the Indonesian Online Health Atlas is a big step in the development of the Indonesian public health system. Based on the results of this study, the project team is in the position to make concrete recommendations, including the acquisition of the data, the type of information that needs to be included, and the time frame for the compilation of the data. 82157476af
